DOMESTIC GRAIN STORAGE BINS

FARM INFORMATION UNIT, DIRECTORATE OF EXTENSION, MINISTRY OF AGRICULTURE, NEW DELHI

Price : 50 Paise

April 1973

No,5

This is the fifth of a series of bulletins being issued by the Farm Information Unit, Directorate of Extension, Ministry of Agriculture, on agricultural and animal husbandry subjects. These bulletins are so written as to give an overall picture of the farming practices in vogue in the country, with suggestions on improvements based on research results.

For any further information, and especially on the recommendations suitable for his locality, the reader is advised to contact the local agricultural officer.

SAVE GRAIN CAMPAIGN

Department of Food, Government of India, have launched a programme to extend the knowledge of scientific storage to farmers, traders and all others who store foodgrains at various levels. This programme known as "Save Grain Campaign" is intended to save the colossal loss of foodgrains which generally occurs in the storage due to insects, rodents, birds and micro-organisms.

An Indian Grain Storage Institute has also been set up at Hapur, U.P. with a field station each at Ludhiana (Panjab) and Bapatla (Andhra Pradesh). The Institute is engaged in applied research in the problems of farms and community grain storage practices and as such is developing and testing improved storage techniques and practices. One of the main activities of the Institute is to design and develop suitable structures of all materials, capacities and types for various grains to suit different regions.

The Save Grain Campaign will mainly draw on the research and development work carried out by the Indian Grain Storage Institute and will disseminate this knowledge to all levels.

This guide has been prepared to assist the manufacturer to fabricate the storage bins developed and tested by the Indian Grain Storage Institute. This is only concerned with the fabrication of two types of Grain Storage Metal Bins, viz: Type I with inclined outlet and Type II with horizontal outlet. See Annexure I for their capacity to store various foodgrains.

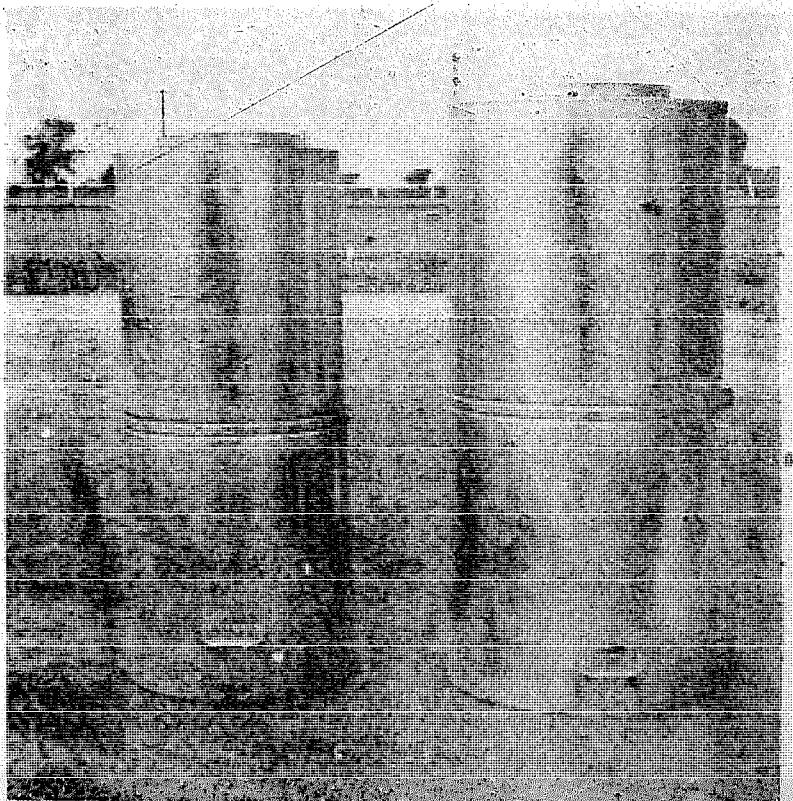

Type I
Domestic Metal Bins
"GHARELU KOTHI"
(Inclined Outlet)

Especially suited for storing wheat and other low moisture foodgrains

Type II
Domestic Metal Bins
"GHARELU KOTHI"
(Horizontal Outlet)

Specially suited for storing paddy and other low moisture coarse foodgrains

GUIDE TO MANUFACTURERS

THIS Guide has been prepared to assist you to fabricate the storage metal bins developed and tested by the Indian Grain Storage Institute.

FOLLOW the step by step procedure and carry out the work accurately to ensure that the bins you fabricate will be in perfect condition and will conform to the Quality Control Standards.

THESE two types are similar, except for the designs and specifications of the inlet and outlet, etc.

FOR the manufacture of Type I Bin consult the detailed technical drawings listed on page 8, and for the manufacture of type II Bin, consult those listed on page 19.

GENERAL INSTRUCTIONS FOR THE FABRICATION OF TYPES I & II

MATERIAL USED : These two types of bins are made of plain galvanised 'Steel' Sheets. Use sheets according to Indian Standard Institution specifications only. Such sheets are to be free of scratches, gauges, water marks or any signs of lifting of the coating. Edges should be straight and true. Length should be carefully checked against requirements and trimmed as required. Corners should be at 90°. The width of sheets is not critical and if in excess of ISI standard dimensions, the excess may be left on, in lieu of trimming, as this will add slightly to the capacity of bins.

CORROSION PROTECTION: All mild steel parts should be thoroughly cleaned of scale, welding, slag

and oil stains removed. The steel should then be brush-painted with one coat of non-lead base metal primer followed by two coats with synthetic exterior enamel paint before assembly.

CLIPS AND CLASPS: These should be in accordance with those shown on the respective drawings. These are, however, standard purchasable items and consequently other types may be submitted for approval, in which case it will be the manufacturers' responsibility to check and if necessary revise the dimensions for attachment. Clips and clasps should be heavy gauge nickel plated to resist corrosion.

TRANSPORTATION: It is suggested that the domestic bins are required to be transported in fully assembled form for short distances. Attention should be given to provide adequate support to the bin while in transport to avoid any damage.

MAINTENANCE: The manufacturer is advised to give instructions to the users for maintenance of the bins. Such instructions should include the following instructions :

- a) "Keep bin clear of floor to allow passage of air. Check bottom surface at least yearly and if necessary paint with metal primer."
- b) "If after prolonged period of use the galvanising is seen to be lifting, the area should be painted with metal primer and finished with aluminium paint."

RECORDING: After assembling the bin you manufacture, record serial No. and the fact that it is an approved design which could form the basis for transactions through banks or other agencies.

~~USERS' INSTRUCTIONS: Always attach the Users' Instruction Sheet as at Annexure II to the bin before delivering it to the customer.~~

QUALITY CONTROL

~~IF the bins described in the attached specification are manufactured under close engineering control with regard to dimensions, gauges and finish and inspected by persons trained in engineering inspection, further inspection should not be necessary.~~

~~HOWEVER, to assist purchasers to check the bins before purchase, the following points are included.~~

1. Check that the inlet lid fits neatly and that clasps will lock the lid in position.
2. Check that inlet and outlet padlocks are supplied.
3. Check that outlet cover fits neatly and that provision is made for locking.
4. Check that all metal parts have been painted; scrape a little of the enamel to check that the metal has also been primed (underneath colour should be brownish red). Check that metal parts have been painted before assembly.
5. Check that all screws and bolts are tight.
6. Check soldering of outlets/inlets and ensure that surface has been well washed to remove acids. No black staining should be present.
7. Check that all steel rivets have been touched up with paint after assembly.

8. Check that all joints are flat and true and have not been damaged, buckled or bent.
9. Check that instruction sheet has been attached, that it is in language understandable to the purchaser and that he understands the meaning.
10. Check that capacity and name have been stencilled on the side-wall.
11. Check that the manufacturer has given maintenance instructions to the purchaser.
12. Check that the overall dimensions of the bin and the cubic capacity as stencilled on the bin are correct.

DETAILED INSTRUCTIONS ON THE FABRICATION OF DOMESTIC TYPE I "GHARELU KOTHI"

DESCRIPTION: The domestic Type I storage structures developed at the Indian Grain Storage Institute are in four basic sizes. They are constructed of mild steel galvanised plain sheets with folded seam joints. The sheets are standard 2 m x 1 m and 8' x 3' although other standard sizes may be utilized to manufacture the same size bins or by using similar techniques to construct bins of alternative dimensions.

A 225 mm diameter inlet is fitted to the top plate and an upward inclined 150mm diameter outlet is fitted in the wall panel near the base. Of the four sizes two are joined at the centre with a clamp ring whereas the other two may be considered as being half of the initial bins with a base added.

SPECIFICATIONS AND DRAWINGS: The drawings for manufacture of Type I bins are as listed herein. Also included thereafter is the suggested manufacturing method. Contact Save Grain Campaign, Ministry of Agriculture, Department of Food, KrishI Bhawan, New Delhi-1 for the drawings.

IGSI/71/134	Typical layout of sheets

FABRICATION PROCEDURE FOR TYPE I BIN:

The Domestic Bin of 0.8 cu. m. capacity has been used as an example. (The same procedures apply to the fabrication of other sizes).

Step No. 1. Top Bin Wall Section P/N IGSI-71-109-1.

Select a 24 gauge G.P. sheet of 8' x 3' size. Set out the lines for folding and cutting the sheet as shown on drg. No. IGSI-71/109. Bend the sheet in opposite direction at the two ends along lines set

out after cutting top corners of the sheet. (See Photo No.1). Join the two folded ends hammer it to make a close joint and then drill and rivet at pitch as set out on drg. Take care that tongues of joints are well seated as otherwise the diameter will be affected. (See Photo No.2). Flange the end of bin-wall in bead-ing machine.

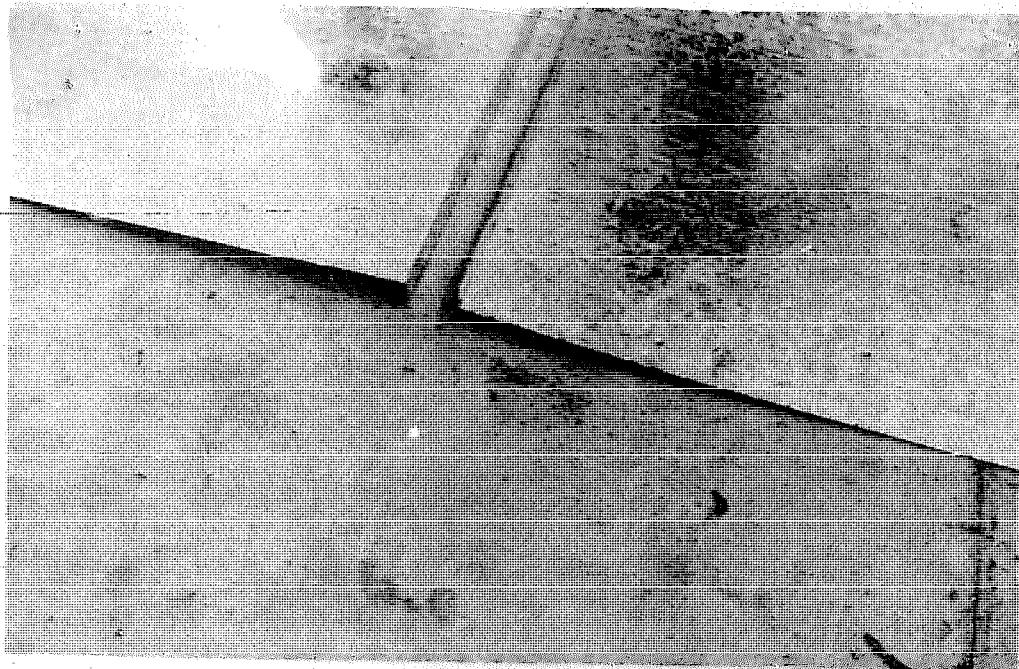

Step No.2. Bottom Bin Wall Section P/N IGSI-71/109-2.

Select a 24 gauge G. P. sheet of 8' x 3' size. Follow the same procedure in marking, folding, cut-ting and joining at the ends as explained in Step 1. Refer to drg. No. IGSI/71/109.

Step No.3. Top Plate P/N IGSI-71/107-7

Select a 24 gauge G. P. sheet. Mark the two circles of correct diameter for cutting and folding as shown in drg. No. IGSI, 71/107. Cut the circular plate

Photo No.1 : Preliminary fold at the end of the wall sheets

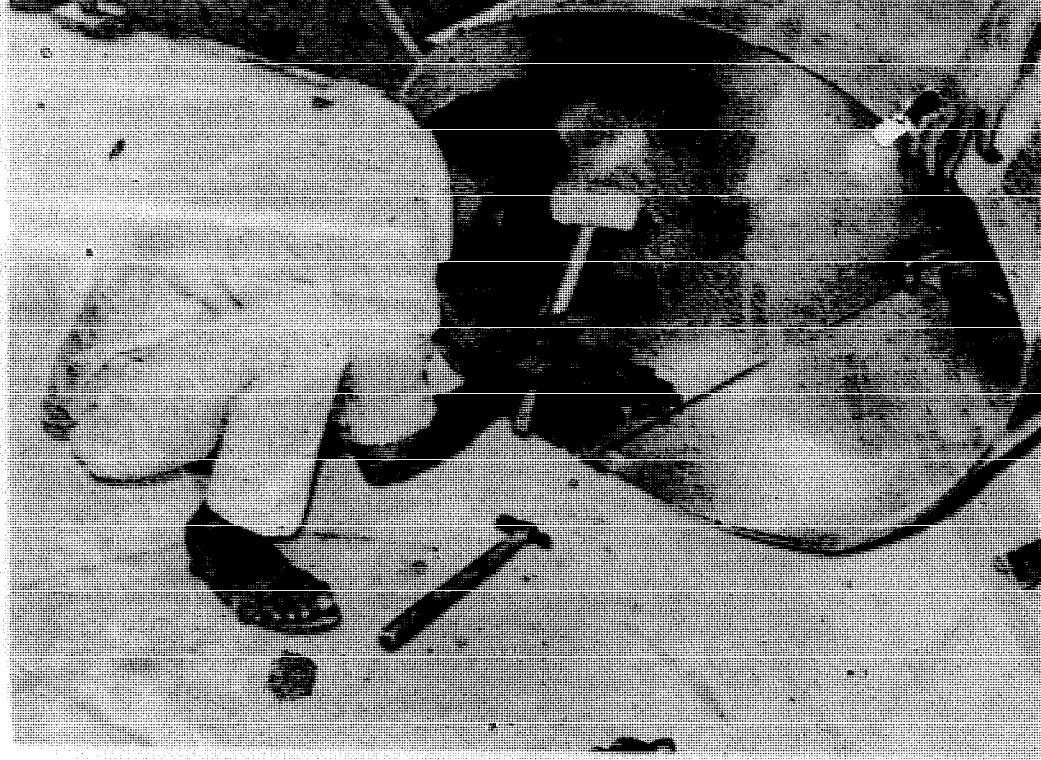

Photo No. 2 : Forming bin well and joining*

along the outer circle as illustrated in photograph No. 3. Fold the plate against the inner circle (See Photo No. 4). Join the top plate over the upper end of the bin wall section. Follow the method of joining the top plate in four stages as shown in drg. No. IGSI-71/107.

Step No. 4. Bottom Plate P/N IGSI-71/107/11

Select a 24 gauge G. P. sheet. Follow the same procedure in marking, folding and joining the bottom plate over the lower end of the bottom bin wall section as explained in Step 3. Refer to drg. No. IGSI-71/107.

Step No. 5. Bin Walls P/N IGSI/71/109-1 & 2.

Provide the grooves at the top edges of the bottom wall section and at the bottom edge of the top wall section at specific distance. Refer to drg. No. IGSI-71/109, P/No. IGSI-71/109-1 and P/No. IGSI-71/109-2 (See Photo No. 5).

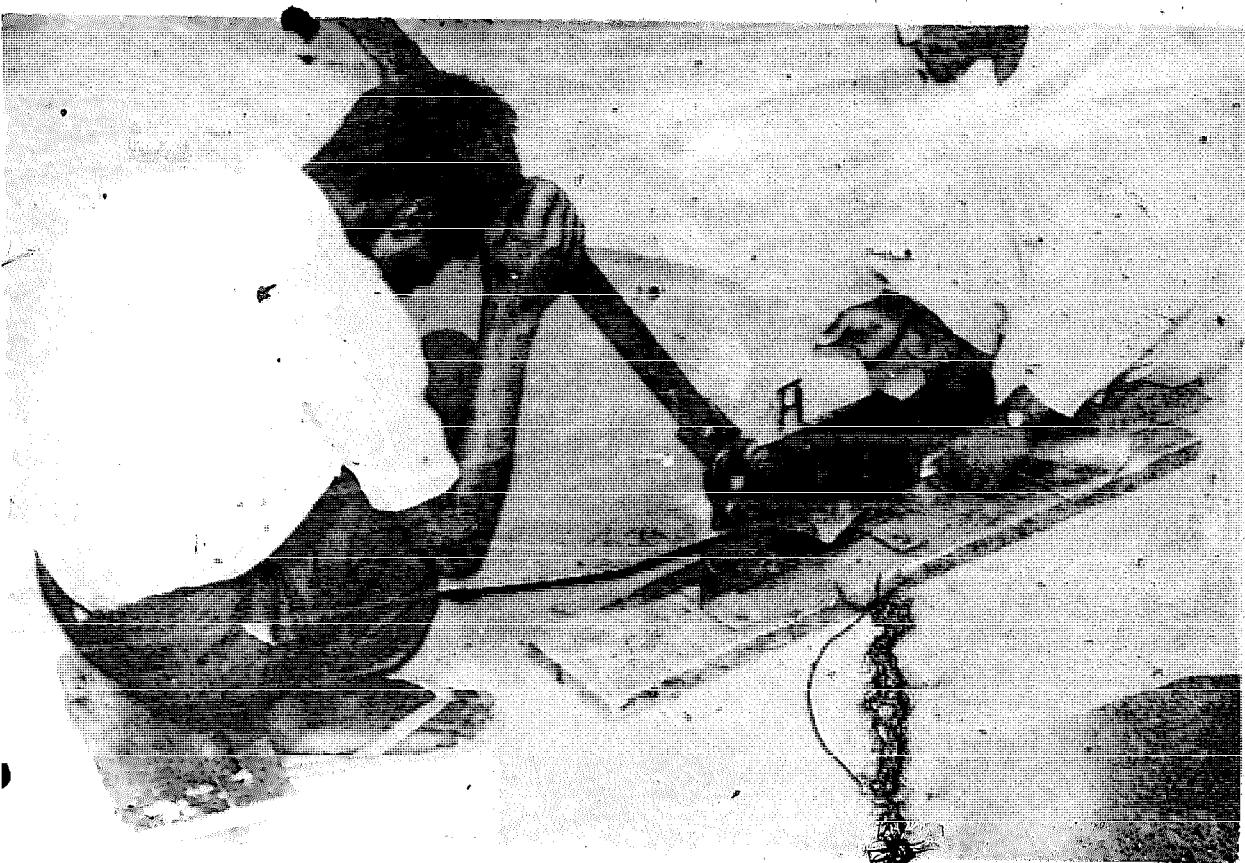

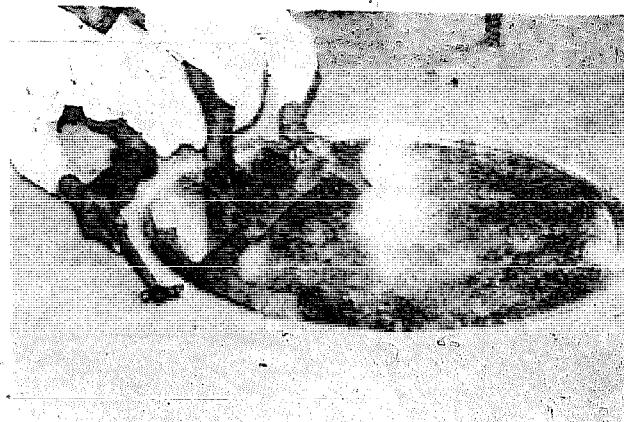

Photo No.4 : Correcting minor imperfections in lip. Note the jig of angle iron curved to the radius of end plate.

Step No.6. Inner Ring P/N IGSI-71/107-13

Fabricate M. S. flat bar ring as per drg. No. IGSI-71-107. Check the outside circumference before welding. Apply metal primer and after drying, fit the inner ring into the upper end of the bottom bin wall section P/No. IGSI-71/107-2. Then fold top edge over

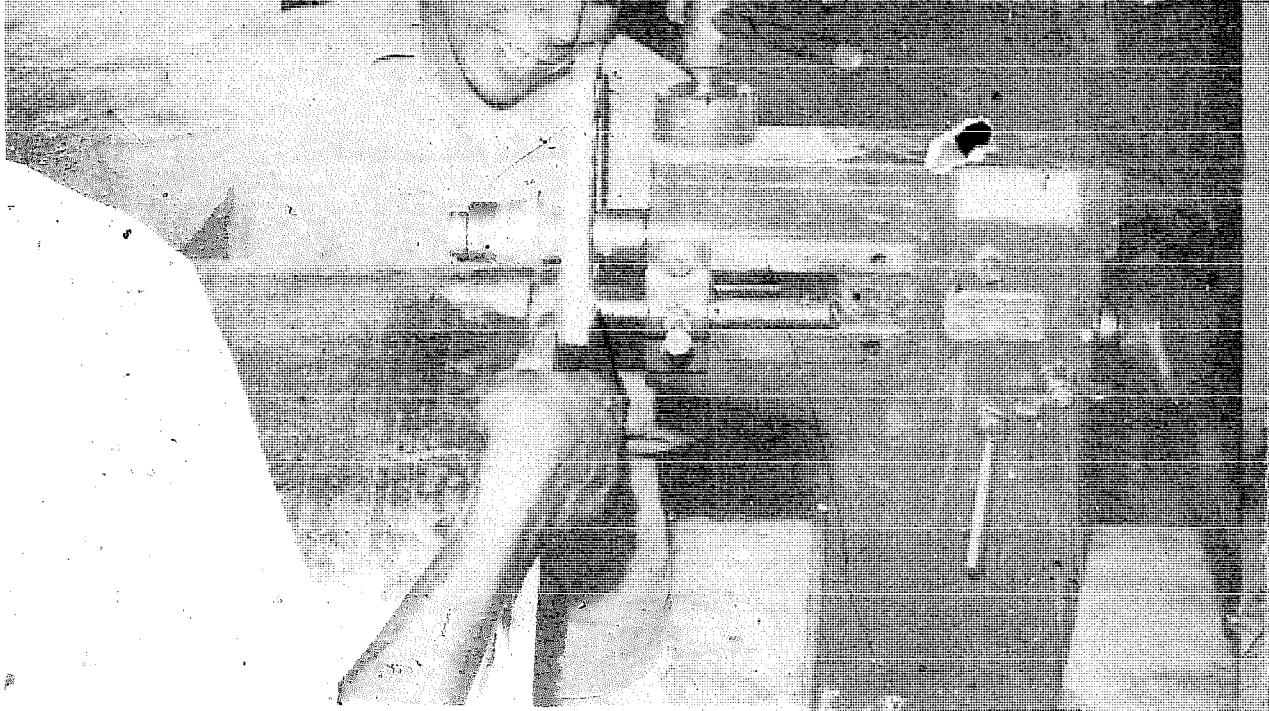

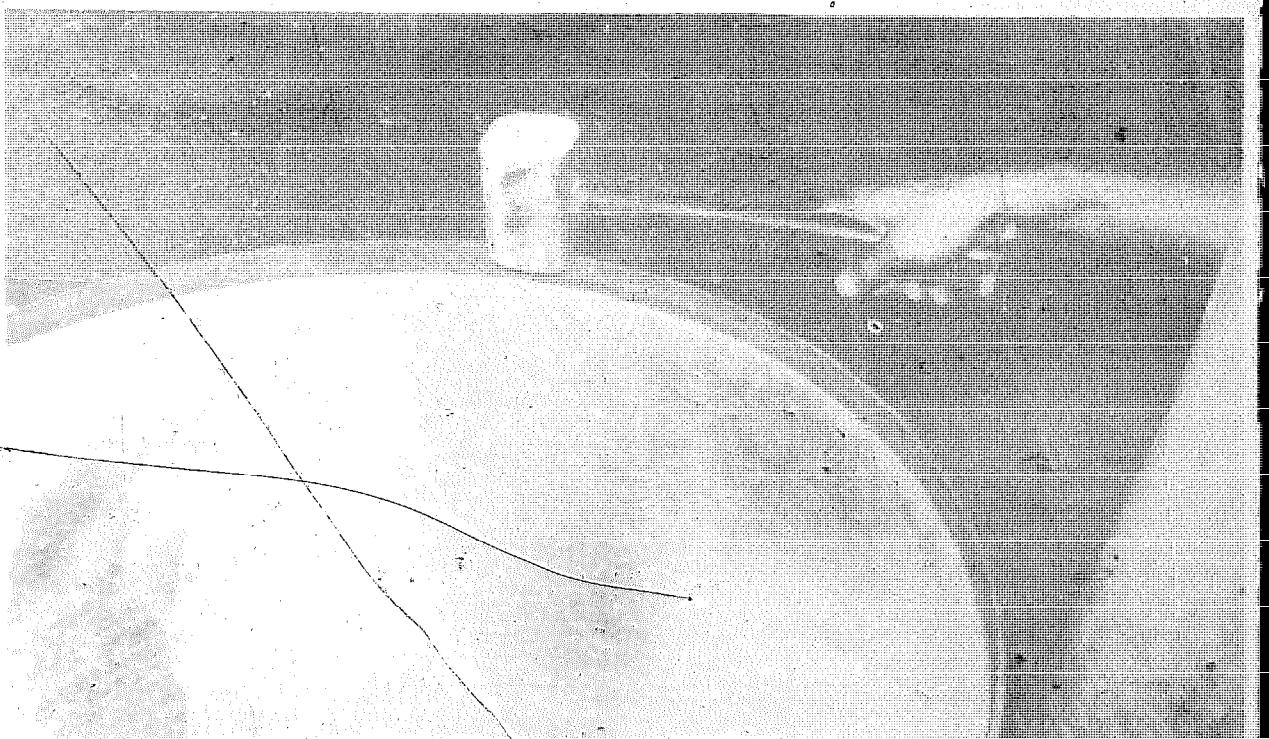

Photo No.5 : Beading the end of bin wall

the ring as shown in drg. No. IGSI-71/107. (See Photo No. 6).

Step No. 7. Inlet P/N IGSI-71-103-3

Cut the circular opening of specific diameter and at the specified distance from the edge of the top plate of the bin. As shown in drg. No. IGSI-71-103 cut a strip from 24 gauge GP sheet.

Photo No.6 : Inner ring in position and lip of bin being turned over

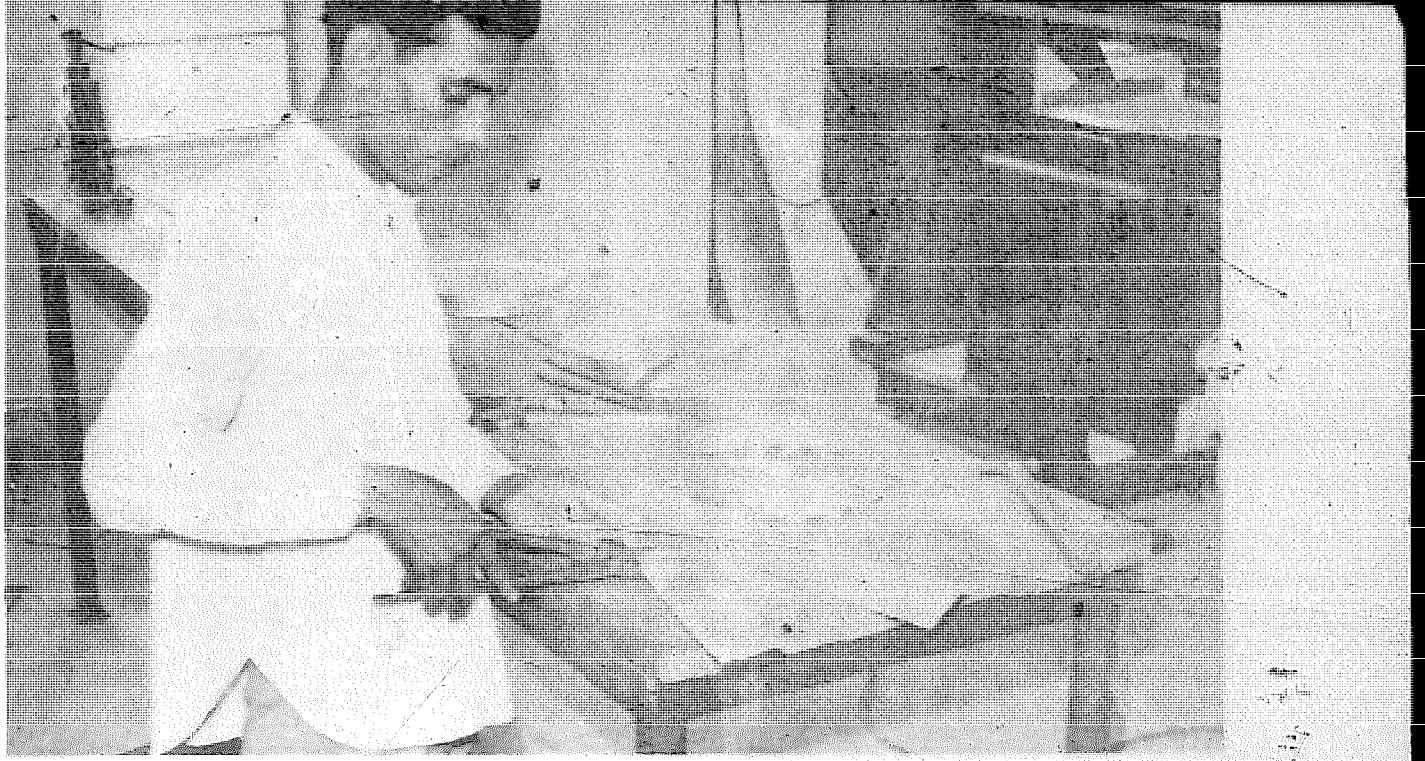

Photo No.7 : Preparing strips for inlet rings

Set out the lines for folding and cut at one end for joining the ends to make a circular ring. Cut tabs along the joining edge 20 mm apart as shown in drg. No. IGSI-71/103 and Photo No.7. Fold outside at the top edge. Now join the two ends to make a circular ring by overlapping and riveting. Fold alternate tabs outward at 90° angle and fix the ring into the inlet opening already cut in the top plate as shown in the drg. No. IGSI-71/107. The unfolded tabs are required to be hammered from inside to make a close joint. Similarly hammer outside tabs also. Then solder tabs with 60/40/tin/lead solder.

Photo No.8 : Preparing outlet spout
after cutting the template shape

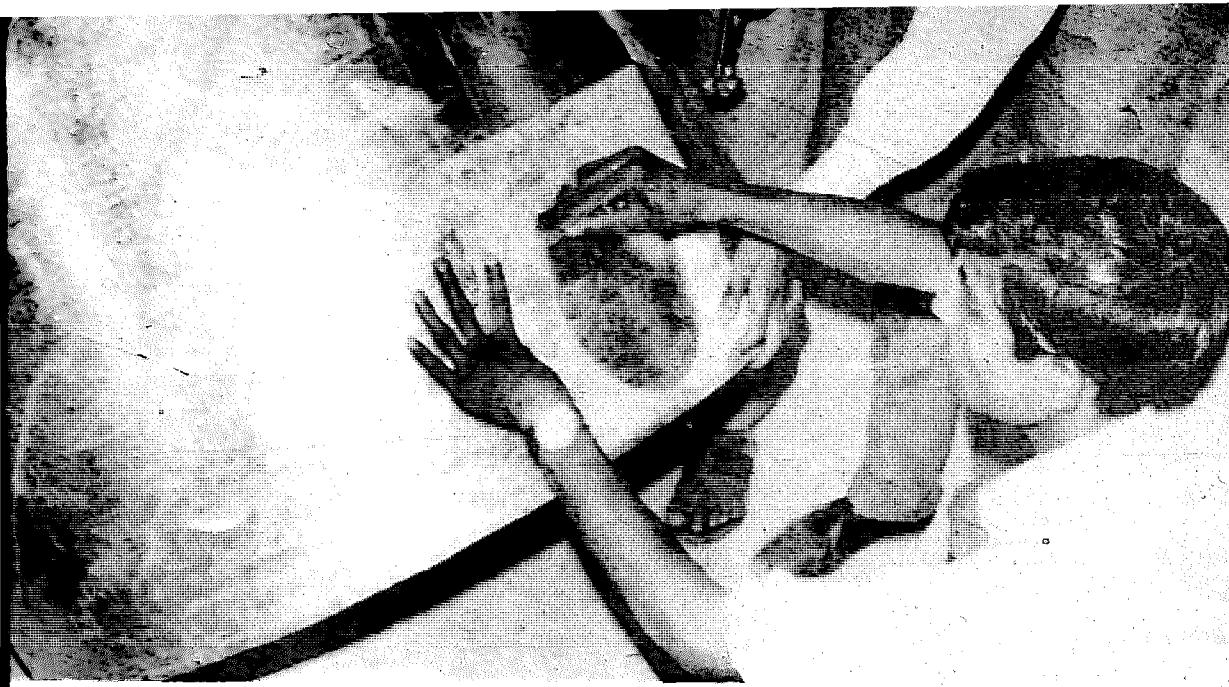

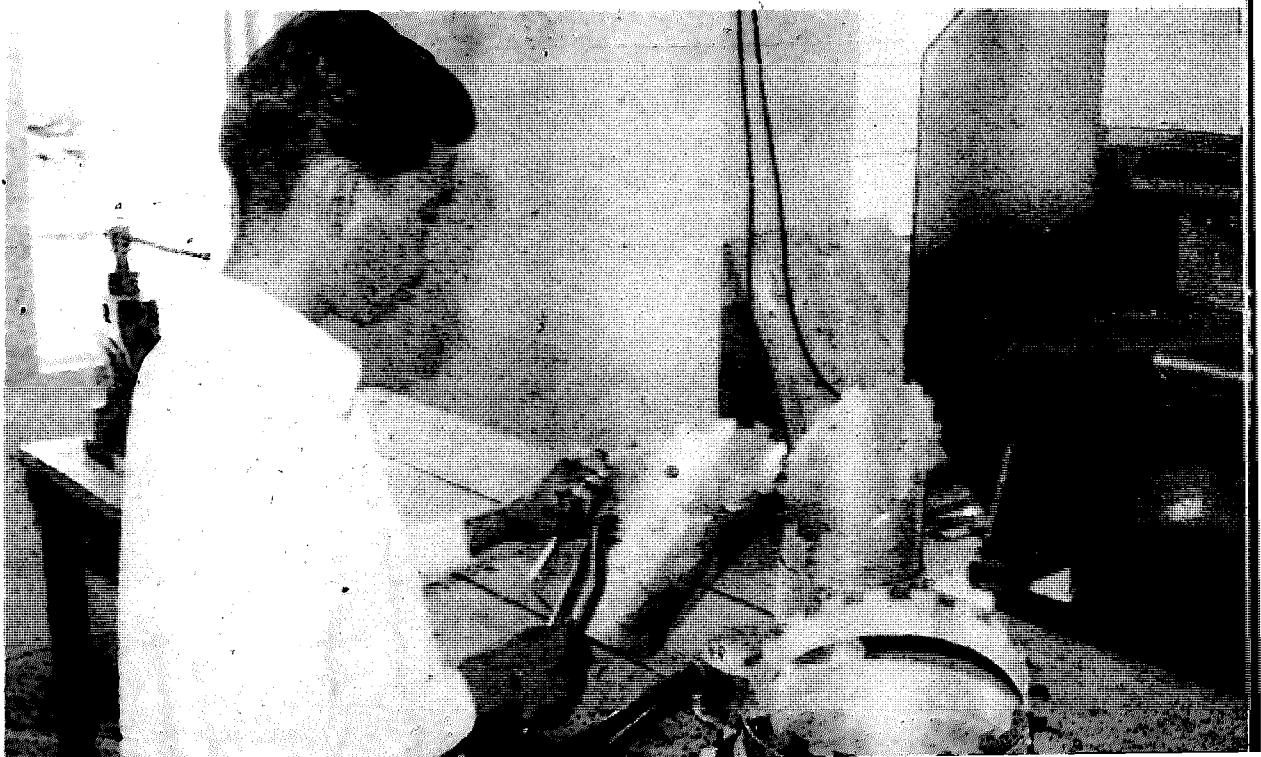

Photo No.9 : Using template to mark out shape to be cut out of lower bin wall for outlet

Step No. 8. Outlet P/N IGSI-71/103-2

Select a .24 gauge G. P. sheet and mark the sheet by setting out lines in accordance with drg. No. IGSI-71/103. As the development drg. shown in above drg. is drawn to $\frac{1}{2}$ scale a template should be made for marking on the sheet to full size. Fold at the upper edge and cut the tabs at the joining end of the outlet. (See Photo No.8). Join the two ends by method of overlapping and riveting to form a cylinder.

Photo No. 10 : Turning over tabs of outlet spout

Now use the completed spout to make a template which may be used ultimately for marking the profile of 'cut out' on the bottom bin wall section at appropriate position as shown in drg. No. IGSI-71-109 and Photo No. 9 . The spout is required to be fixed in upward inclined direction. Cut out the outlet opening. Fold alternate tabs outwards at approximately 90° angle. (See Photo No.10). Fix the spout into the outlet opening. The unfolded tabs are required to be hammered from inside to make a close joint (See Photo No.11). Similarly hammer outside tabs. Then solder to make air tight and water tight joint.

Photo No.11: Hammering tabs flat against the inside of the bin wall

Step No. 9. Inlet lid P/N IGSI-71/106-2

Select 24 gauge G. P. sheet. Fabricate the inlet lid as per drg. No. IGSI-71-106. provide two clasps, diagonally opposite each other at specific position so that the lid can be locked in position.

Step No. 10. Outlet lid P/N IGSI-71/106/1

Select 24 gauge G. P. sheet. Fabricate the outlet lid as per drg. No. IGSI-71/106. Provide two clasps diagonally opposite each other at specified position so that the lid can be locked in position.

Step No. 11. Clamp Ring P/N * IGSI-71-108

Select 20 gauge sheet. Cut a strip of exact length and width. Make two grooves lengthwise at 35 mm CRS apart on beading machine, as shown in drg. No. IGSI-71/108. (See Photo No. 12).

To make the two clamps (P/N 71-108-Ib) use 16 gauge G. P. sheet. Cut the pieces of appropriate sizes as shown in above drg. Set the lines for folding and the holes for riveting. Fold each piece at the centre to form a semi-circular groove. Fix the clamps by riveting at the two ends of the clamping strip in the desired position.

Photo No. 12 : Preparing grooves for clamp ring

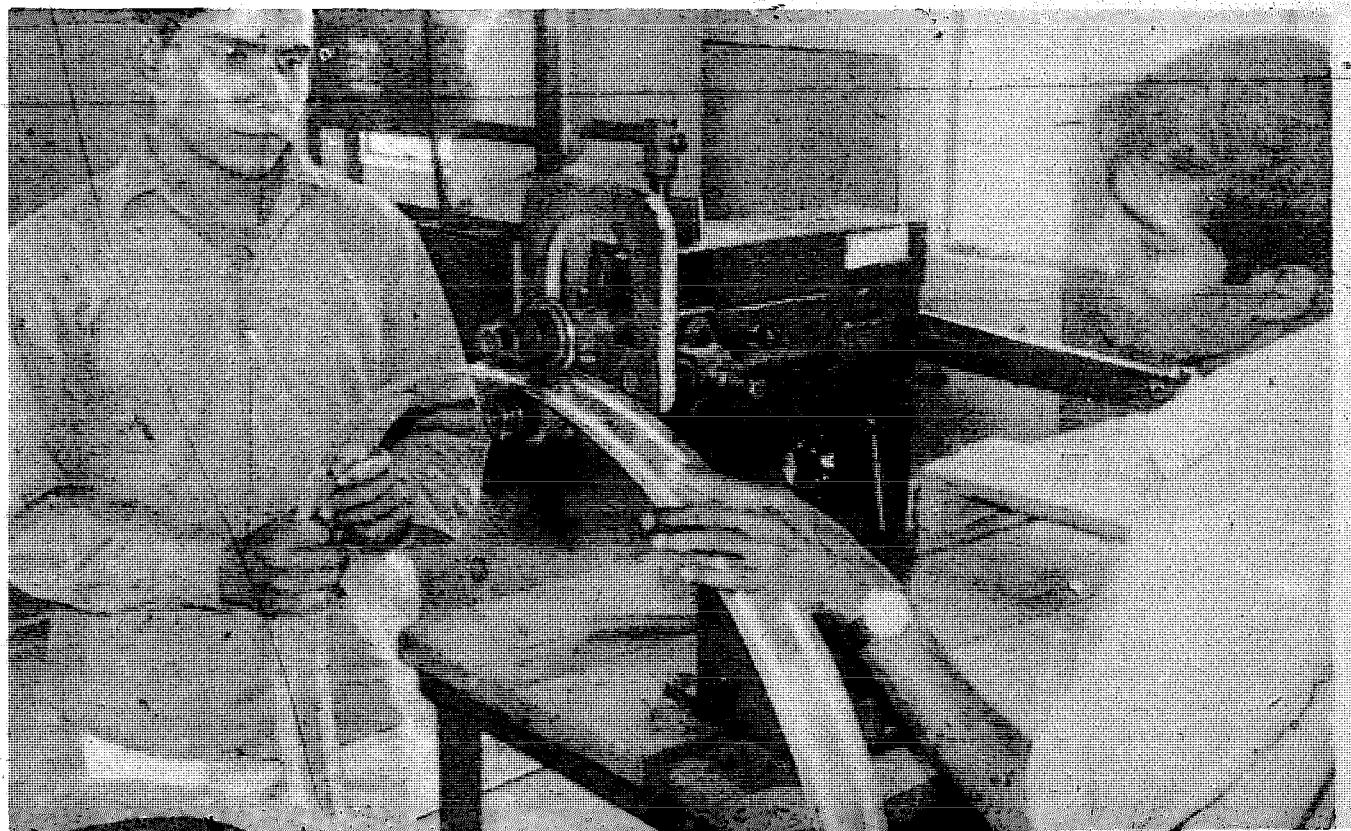

Photo No.13: Clamping ring in position

Photo No.14: Inlet lid with locking arrangement

Step No. 12. Assembly

The lower end of the top wall section is slipped over the top end of the bottom wall section so that the grooves provided in the top wall section come into contact with stiffening ring. Fix the

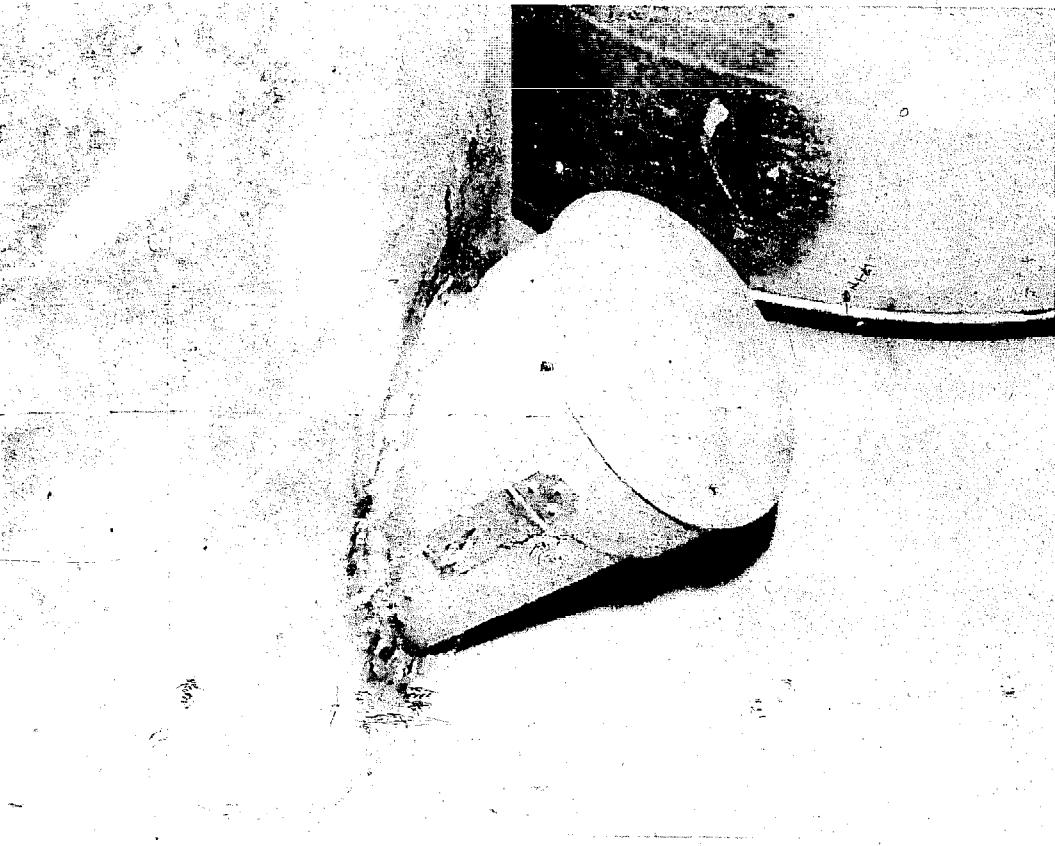

Photo No.15 : Outlet lid with locking arrangement

clamping ring with grooves covering the overlap joint and lying into the grooves in the bin walls. Fix deeper groove to bottom. Fix the clamping bolt of correct size and length with metal washers at both ends and tighten. (See Photo No.13). Tap over edges of clamp ring if these tend to stand out from the bin wall.

Step No. 13. Locks

Provide the locking arrangements at the inlet and outlet. (See Photos Nos. 14 & 15). Photo on front page shows the 4 sizes of domestic bins.

Step No. 14. Instruction sheet

Attach 'Users' Instructions' in regional language.

Step No. 15. Stencil name and capacity on bin.

DETAILED INSTRUCTIONS ON THE FABRICATION OF DOMESTIC TYPE II "GHARELU KOTHI"

DESCRIPTION: The domestic type II storage structures developed at the Indian Grain Storage Institute are in four basic sizes. They are constructed of mild steel galvanised plain sheets with folded seam joints. The sheets are standard 2 m x 1 m and 8' x 3'. Other standard sizes may be utilised to manufacture the same size bins. Otherwise construct bins of alternative dimensions by adopting similar techniques.

A 450 mm diameter inlet is fitted to the top plate and a horizontal 150 mm diameter outlet fitted in the wall panel near the base. Of the four sizes two are joined at the centre with a clamp ring whereas the other two may be considered as being half of the initial bins with a base added.

SPECIFICATIONS AND DRAWINGS: The drawings for the manufacture of these bins are listed herein. Also included thereafter is a suggested manufacturing method. Contact Save Grain Campaign, Ministry of Agriculture, Department of Food, Krishi Bhawan, New Delhi for the drawings.

To construct the type II bins reference is to be made to the drawings listed under type I Plus the following :-

<u>Drawing No.</u>	<u>Title</u>
IGSI/71-211 (Conversion)	Schedule of Components
IGSI/71-202	Domestic II General Arrangement
IGSI/71-203	Domestic II Inlet and Outlet Covers
IGSI/71-207	Domestic II Inlets and Outlets
IGSI/71-206	Domestic II Instruction Sheet
IGSI/71-210	Details of Conversion from Type I to Type II

FABRICATION PROCEDURE FOR TYPE II BIN :

The Domestic Bin of 0.8 cu. m. capacity has been used as an example. The type II domestic storage bin is basically similar to the type I except that different outlets, slides, inlets, covers and instruction sheets are provided. Many parts are identical and additional drawings are provided to show the variations where applicable.

Step No. 1. Top Bin Wall Section P/N IGSI-71-208

To construct top bin wall section follow the same instructions as in Step-1 under Fabrication Procedure for Type I Bin and details shown for Part No. 71-109-1.

Step No. 2. Bottom Bin Wall Section P/N IGSI/71/208

To construct bottom bin wall section follow the same instructions as in Step-2 under Fabrication Procedure for Type I Bin and details shown for Part No. 71-109-2 except the outlet hole which should be cut to instructions in drg. No.IGSI-71-210.

Step No. 3. Top Plate P/N IGSI-71-209-7

To construct top plate follow the same instructions as in Step-3 under Fabrication Procedure for Type I Bin and details shown for Part No. 71-107-7 except the inlet hole which should be cut to dimensions shown in drg. No.71-210

Step No. 4. Bottom Plate P/N IGSI-71-209-8

To construct bottom plate follow the same instructions as in Step-4 under Fabrication Procedure for Type I Bin and details shown for Part No. 71-107-8.

Step No. 5. Bin Walls P/N IGSI-71/209-13

For grooving follow the same instructions as in Step-5 under Fabrication Procedure for Type I Bin.

Step No. 6. Inner Ring P/N IGSI-71/209-13

To construct inner ring follow the same instructions as in Step-6 under Fabrication Procedure for Type I Bin and details shown for Part No. 71-107-13.

Step No. 7. Inlet P/N IGSI-71/207-3

Cut the circular opening of specific diameter and at the specified distance from the edge of the top plate of the bin as shown in drg. No. IGSI-71/207. Turn up lip as shown. To fabricate inlet P/N IGSI-71-207-3 cut a strip from 24 gauge G. P. sheet. Set out the lines for folding and cut out at one end for joining the ends to make a circular ring by overlapping and riveting. Fold lower 6 mm inwards at 90° angle, fix the ring on to the inlet opening already cut in the top plate. Assemble inlet ring as shown on drg. No. IGSI-71-210.

Step No. 8. Outlet P/N IGSI-71-207-2

Select a 24 gauge G. P. sheet and mark the sheet by setting out lines in accordance with drg. No. IGSI-71/207. The development layout shown in the above drawing indicates all dimensions to make a template which should then be used for marking on the sheet. Fold at the upper edge and cut the tabs at the joining end of the outlet. Join the two ends by method of overlapping and riveting to form a cylinder.

Now use the completed spout to make a template which may be used ultimately for marking the profile of 'cut out' on the bottom bin wall section at appropriate position as shown in drg. No. IGSI-71/210. The

spout is required to be fixed in by the tabs. Cut out the outlet opening. Fold alternate tabs outwards at approximately 90° angle. Fix the spout into the outlet opening. The unfolded tabs are required to be hammered from inside to make a close joint. Similarly hammer outside tabs. Then solder to make air tight and water tight joint. Solder on front plate as shown in drg. No. PN IGSI-71-207-lb.

Step No. 9. Inlet Lid P/N IGSI-71-203-2

Select 24 gauge G. P. sheet. Fabricate the inlet lid as per drg. No. IGSI-71-203. Provide two clasps, diagonally opposite each other at specific position so that the lid can be locked in position.

Step No. 10. Outlet Slide P/N IGSI-71-203-

Select 18 gauge G. P. sheet. Fabricate the outlet slide as per drg. No. IGSI-71-203. Provide hole for padlock as shown so that the cover can be locked in position.

Step No. 11. Clamp Ring P/N IGSI-71-204-1

To construct clamp ring follow the same instructions as in Step-11 under Fabrication Procedure for Type I Bin and details shown for Part No. 71-108-1.

Step No. 12. Assembly

The lower end of the top wall section is slipped over the top end of the bottom wall section to come into contact with stiffening ring. Fix the clamping ring with grooves covering the overlap joint and lying in the grooves in the bin walls. Fix deeper groove to bottom. Fix the clamping bolt of correct size and

length with metal washers at both ends and tighten.. Tap over edges of clamp ring if these tend to stand out from the bin wall.

Step No. 13. Locks

Provide the locking arrangements at the inlet and outlet.

Step No. 14. Instruction Sheet

Attach 'Users' Instructions' in regional language.

Step No. 15. Stencil name and capacity on bin.

ANNEXURE II

"USERS' INSTRUCTIONS"

1. Check your bin to find out that
 - a) Lids fit correctly
 - b) Edges are not damaged
 - c) Centre clamp is tight
 - d) Joints are well made.
2. Transport and handle bin carefully.
3. Clean thoroughly the inside of the bin.
4. Keep your bin indoor.
5. Keep the bin on a layer of bricks or wooden batons.

6. Clean your grain by removing dirt, chaff and other foreign matter.
7. Sun-dry your grain well before storage, because grain with high moisture gets spoiled in storage.
8. Do not mix new grain with old insect infested grain while storing.
9. Store insect-free grain. Fumigate with E.D.B. or E.D.C.T. immediately after storage to kill hidden infestation.
10. Inspect your grain fortnightly for possible development of insect infestation. If infestation is found, fumigate with E.D.B. or E.D.B. Ampoules.
11. Always replace lids.
12. Consult your nearest BDO for assistance and advice on your storage problems.
