build of a man, and to be reproduced as nearly perfect as is possible to human ingenuity is what has been sought in this work. The author has so far succeeded that of the many who have studied, either by direct instruction or by the aid of this publication, not one has failed to enjoy the fullest confidence of their clientage. Particularly is this system of value where cutting has to be done without "try-on" and at no time can a garment be spoiled. The perfect points being the fundamental object of this method.

PREFACE

In placing this work before the Cutting Fraternity, we feel confident that we have placed before them something that is useful and practical. Unlike any other work of its kind, its construction is simple and easy to understand. It has been our aim to eliminate all discussion of an anatomical nature, for we do not pretend to teach anatomy, nor do we try to convince the student of something we are not convinced of ourselves. We do claim that our work is absolutely practical, and correct, its measures are simple, and applied on the pattern exactly as taken and they cover any and all points that have heretofore confused the cutter. There will be no need for the cutter to mark on the book "R. B." for round back or "O. E." for over erect or any other sign by which to know the shape of his customer, for his measurements will show all such points. We feel certain that any cutter following the instructions of the AMERICAN GARMENT CUTTER will be satisfied with the results obtained.

THE AUTHOR.

THE MEASURING OF THE HUMAN BODY

The fact that in order to perfectly fit the human body, it requires perfect measurements, cannot be too often urged upon the cutter, and not only that, but it requires much tact on the part of the cutter to get his customer to forget that he is being measured. A fact, well known among cutters is, that ninety-nine out of one hundred men will pose, unconsciously perhaps, while being measured. It is common to see a man standing erect, with shoulders thrown back and chest expanded, and if you were to ask him to stand naturally, he would be indignant and answer, "Why, of course this is my natural position," but if after the garment is completed he stoops forward, his chest sunken in, his back rounded, it will then be necessary for the cutter to either make a big alteration or a new garment; so it will readily be seen that the cutter who can make his customer forget that he is being measured, has the best chance of success.

HOW TO MEASURE

Before measuring it is well to see that the sides of the Vest are not too loose; if necessary, pin up both sides of the Vest, but see that the center seam of the back is in the right place.

Use the ordinary division square. Place square under the arm with the long end down and parallel with the body. (See Fig. 1.) The short end to be close, but not tight, under the arm; make a chalk mark on top of it in front, and, still holding the square in the same position, make a mark on the side of the back, and remove.

FIGURE 1

HOW TO MEASURE—Continued

Now place the short end of the square under the arm with the long end upward (see Fig. 2), still keeping the inner edge of it close, but not tight, at the front scye; mark at the outer edge of it across the first line, so that it leaves a cross mark at the front scye (see Fig. 3). Now place the square under the other arm and mark the same way at front and side of the back.

FIGURE 2

HOW TO MEASURE—Continued

The cross mark shown on the front in Figure 3 shows where the line of scye depth and blade line cross.

FIGURE 3

HOW TO MEASURE—Continued

Place the long end of the square across both marks on the back and mark across the center seam (see Fig. 4); this gives the scye depth. Now find the socket bone, or from above the collar button at the back, measure to the scye depth, divide in half and mark across the center seam.

To get the waist length, put the tape line around the waist just above the hip bone, and mark across center seam of back. measure 6 inches down for the hip. It is easily understood that no matter where the hip may be, as long as you go down the same distance for the draft, as the measure, you must be right.

We will now proceed to measure.

First from the socket bone to the scye depth; on to the waist line; on to the full length. Now place the tape line to the back collar button (Figure 4) and measure to cross line on front (Fig. 3) for strap measure; then from line half way between socket bone and scye depth, to the same cross line on front for over-shoulder measure.

Then from front cross line (Fig. 3) under arm and over the blade bone to the center seam of back for blade measure.

Then breast, not tight; waist, and hip.

In taking the breast measure be sure that your tape string is over the most prominent part of the blade bone.

THE VEST

If measured for a suit all that is needed is the opening and full length measure.

FIGURE 4

HOW TO MEASURE—Continued

TROUSERS

Measure the outside seam from the hip bone to the top of heel.

For the inseam have the trousers well drawn up and measure from the crotch to the top of heel, then the waist, hip, seat, thigh, knee and bottom.

THE SQUARE

The square used for these diagrams is a plain division square, understood by most cutters, but for the benefit of those who do not understand it, we herewith give an explanation of the divisions of same.

The long end of the square is divided into $\frac{1}{2}$, $\frac{2}{3}$, $\frac{1}{3}$, $\frac{1}{2}$, $\frac{1}{4}$ the short end is divided into $\frac{1}{2}$, $\frac{1}{4}$, $\frac{1}{8}$, $\frac{1}{16}$ and $\frac{1}{32}$. Should you try to find $\frac{1}{8}$ of any size, say 36, 40 or 48, look at the short end of the square marked $\frac{1}{8}$, and there you will find the number you want, 18 for 36, 20 for 40, or 24 for 48. Should you want $\frac{1}{2}$ of any size, look at the same short end of square marked $\frac{1}{2}$, or if you want $\frac{1}{6}$, $\frac{1}{3}$ or $\frac{1}{12}$ look at the long end for the mark $\frac{1}{3}$, $\frac{1}{6}$ or $\frac{1}{12}$ and you will find it.

In drawing for square lines be sure that you hold your square on the one line firmly, while drawing the right angle, for one line off will spoil the whole draft.

LESSON I.

SINGLE BREASTED SACK COAT

We will now begin with our first lesson, the ground work.

This is to be a single breasted sack coat.

The measures are as follows

Seye depth,	9½ inches	Blade,	13 inches
Natural waist,	17 inches	Breast,	38 inches
Full length,	30 inches	Waist,	34 inches
Strap,	12¾ inches	Seat,	39 inches
	Over shoulder,	14½ inches	

Square lines A—N and A—F.

A to B is seye depth, 9½ inches; B to C is ¾ inch; this ¾ inch allowance is for the three seams that we lose—¼ inch at the center seam of the back, and ¼ inch each at the back and front shoulders.

A to D is waist length, 17 inches. D to E is 6 inches always, same as measure. F is full length plus ¼ inch.

Square out from B, C, D, E and F. G is half way between A and B.

At D go in ½ inch in all sack coats except on box or straight back coats.

Draw a line from the ½ inch line, point up to G and down to F.

From the line just drawn at B to H is ½ of full breast—19 inches.

H to I is 3½ inches; square down from I.

J is half way between the inner line at B and H.

K to L is 3½ inches always. Square down from K.

Now apply the blade measure from the line inside of B to wherever it comes; in this case the blade measure is 13 inches and comes even with the lower line, but let it be understood that the blade line is independent of the line squared down from K, and may be ¼ inch, ½ inch, or 1 inch in or out of that line, according to measure. (*See diagrams 8 and 9.*)

Square up from where the blade line comes, and make no allowance for seams, as in placing the square in front of the arm seye you have already made allowance, the width of the square being 1½ inches, which makes just five seams.

K to L is ¼ the distance from A to B.

The seye depth in this case being 9½ inches, make the distance from K to L, 19 on 6th division of the square.

Square up from L.

LESSON I.—Continued

P is half way between the line inside of B and K.

P to Q is $1\frac{1}{4}$ inches. Square up from Q. From r to R is $\frac{1}{4}$ breast always. From R to S is $1\frac{1}{2}$ inches.

Square out from S. S to T is about $\frac{3}{4}$ inch, more or less, according to the style of shoulder. From P to back line is about $\frac{3}{4}$ inch, more or less, according to style and taste. However, in cases where a full or straight back is wanted, cut the back wide, say from P to back line 1 inch. Square down.

A to U is $\frac{3}{4}$ inch more than $\frac{1}{2}$ breast.

Square up from U.

U to V is $\frac{5}{8}$ inch.

Draw a line from midway between U and V to T. Shape the back.

M is half way between K and L.

Measure back from A to V, apply same to K and up to N, which is strap measure— $12\frac{3}{4}$ inches; add $\frac{1}{4}$ inch to it, making 13 inches.

Draw a line from N to G. Square forward from N. N to 14 is $\frac{1}{4}$ breast. 14 to 13 is $1\frac{1}{2}$ inches. N to O is $\frac{1}{2}$ breast.

Place the square at O and M and square forward.

Draw a line from 13 to 1.

From Z to 2 is $\frac{1}{2}$ waist, 17 on half division of the square. From 2 to 3 is $1\frac{1}{4}$ inches. From 3 back to 4 is $3\frac{1}{2}$ inches.

Shape front through 1 and 3 down.

Note that in placing point R $\frac{1}{4}$ breast from the lower line always, you get the proper slope of the shoulder. For if the scye depth is short, it will give a square and narrow shoulder, and if long, a sloping wide shoulder. However, in case of a sloping shouldered man wanting his shoulders padded heavily, you may make the distance from R to S $1\frac{3}{4}$ or 2 inches, according to the amount of padding wanted.

DIAGRAM 2

LESSON I.—Continued

Measure back from 9 to E, apply to 8 and back to 10, seat measure, plus $\frac{1}{2}$ inch.

Measure back 7 to D, apply to 4 and back to 6, waist measure, plus 1 inch; draw a line from 6 to 10.

Between front and back at Q take out $\frac{1}{2}$ inch, the amount of cloth it would take for seams if you were to cut an underarm fish. Shape the side of the front.

Sweep from 12 to 15, pivoting at N.

Straighten out the bottom of forepart.

The height of the pocket is $\frac{2}{3}$ of the sleeve length, measured on the inseam. For instance, if the sleeve length be 18 inches, look for 18 at the long end of the square, marked "2 Thirds"; 12 inches from the armseye, and mark the pocket parallel with the bottom of the front; make line Z—K the center of it, and mark $\frac{1}{6}$ of the breast each side of it.

For a one or a four button sack, mark the last button $1\frac{1}{4}$ inches above the pocket.

For a three button sack mark the last button opposite to the ticket pocket or $3\frac{1}{2}$ inches above the side pockets.

DIAGRAM 3

LESSON I.—Continued

Cut the back out, and place point V on point X, measure over shoulder from G through X to K, swing the back until you get the proper measurement with $\frac{1}{2}$ inch allowance, mark at X; sweep from point X to Y, pivoting at M. Reshape shoulder and finish.

HOW TO GET THE OVER-SHOULDER MEASURE.

ACTUAL MEASUREMENTS WILL SHOW FIGURE

A question often asked by the student is, "How are we to know a stooping from an erect figure?"

The answer is, "The measurements will show;" on diagram 5 is a draft of a normal figure; that is, the distance from A to B is the same as L to N, which shows that the back and front are of the same height and normal.

DIAGRAM 5

ACTUAL MEASUREMENTS WILL SHOW FIGURE**Continued**

On diagram 6 we have an erect figure where the distance from L to N is greater than from A to B, which shows that the person is flat in the back and full on the front shoulder, and leans backwards.

DIAGRAM 6

ACTUAL MEASUREMENTS WILL SHOW FIGURE
Continued

On diagram 7 we have the stooping figure where the distance from A to B is greater than L to N, showing that the person is round shouldered and stoops forward; but the blade also plays an important part in the make-up of a person; for instance, on a normal figure the width of a front across the breast from K to I is $\frac{1}{4}$ of breast measure. (*See diagram 8.*)

DIAGRAM 7

These measures are the same as on previous draft, Diagram 7, except that the blade measure is $\frac{1}{2}$ inch smaller, that is $12\frac{1}{2}$ instead of 13 inches, causing the back to decrease from B to P, while the front, from K to I, is increased to 10 instead of $9\frac{1}{2}$ inches, thus showing a full breast and flat back.

DIAGRAM E

FULL BACK—FLAT BREAST

These measures are the same as on Diagram 5, except that the blade measure is increased to $13\frac{1}{2}$ inches, causing the back from B to P to increase, while the breast from K to I has decreased to 9 inches, showing that the back is round while the breast is flat.

Diagram on page 43 shows a very good way to cut a concave shoulder.

FOUR BUTTON MILITARY SACK

HOW TO CUT A CONCAVE SHOULDER.

The trouble that cutters usually experience in trying to get concave shoulders is that they fail to make provision for the stretching of it, and thus lose the original position of the shoulder point. A good test of this is: take the fronts of any ordinary coat and stretch the hollow of the gorge, the shoulder and the armseye, then lay the original pattern upon it and see the result.

The following diagram shows a very good way to get a concave shoulder:

After the pattern has been cut according to measurements, double your front over, say $\frac{1}{2}$ inch, as from E to F, the result will be to bring the shoulder point over as from solid line A to broken line B, and from solid line C to broken line D. Stretch the hollow of the gorge, the shoulder and armseye as marked on diagram.

A FEW WORDS IN REGARD TO WAIST SUPPRESSION

In order to get the proper amount of blade pocket, or roundness over the blade bone, we herewith place 3 different diagrams for 3 different figures, namely, the normal, the flat back and the round blade to show how the waist suppression changes the blade fullness.

DIAGRAM A

The measurements of this draft are:

Blade,	13 inches
Breast,	38 inches
Waist,	34 inches

This blade is considered normal for the breast measure as it leaves the distance from L to J $9\frac{1}{2}$ inches, or $\frac{1}{4}$ breast. The distance from 2 to 3 is $1\frac{3}{4}$ inches.

Cut out the back and place point O to side body and point I to 4, and the distance from 28 to 29 over-lapped is $\frac{3}{4}$ inch.

FULL BREAST—FLAT BACK

DIAGRAM B

Blade,	12½ inches
Breast,	38 inches
Waist,	34 inches

The distance from 27 to J is 10 inches, showing the person to be full breasted with flat back, in which case proceed as follows:

From 2 to 5 is 1¾ inches; from 27 to L is ½ inch; take out ½ of that distance, ¼ inch, and place it from 5 to 3.

The distance from 6 to 7 will be ¾ inch; cut out the back and place point T to side body and point I to 4, and the distance from 28 to 29 over-lapped is a little less than ½ inch, thus showing a small blade pocket.

DIAGRAM B
FULL BREAST, FLAT BACK

FULL BACK—FLAT BREAST

DIAGRAM C

Blade measure from B to 26 is $13\frac{1}{2}$ inches.

Breast, 38 inches

Waist, 34 inches

The distance from 26 to J is 9 inches, showing the person to be full backed and flat breasted.

Proceed as follows:

From 2 to 3 is $1\frac{3}{4}$ inches.

From L to 26 is $\frac{1}{2}$ inch.

Take $\frac{1}{4}$ inch off from 3 to 5, which is $\frac{1}{2}$ the distance from L to 26, and take out balance of waist between 6 and 7.

Cut out the back and place point T to sidebody and point I to 4 and the distance from 28 to 29 over-lapped is $\frac{3}{4}$ inch, showing a large blade pocket.

Inside length,	32 inches	Bottom,	19 inches

B to C is inside length, 32 inches.

D is 2 inches more than half way between B and C.

A to 3 is 3 inches.

However, the distance between K and A must never be less than 1 inch.

CORPULENT MAN'S TROUSERS

TROUSERS FOR A BOW-LEGGED PERSON.

After the measures have been taken as usual, ascertain the amount that the legs are bowed, by having the person stand with both feet together. Draft your forepart accordingly. If the bow be two inches, cut in the forepart as from R to N and at 2.

From R to 1 is $\frac{1}{2}$ inch.

From 2 to 3 is $\frac{1}{2}$ inch.

Pin the pattern over figure 2 on the figure 3 and letter R to figure 1, after which place them on a clean sheet of paper. (See Diagram II.) Straighten out the inseam and measure the length from F to M so that you get the proper length. Now cut the back part accordingly. (See Diagram III.) If the bow be 1 inch, then it is not necessary to cut it in two places, $\frac{1}{2}$ inch between 2 and 3 will be sufficient.

A FEW REMARKS ABOUT MAKING COATS.

THE CANVAS.—The canvas and hair cloth should always be cut on the bias.

SACK COATS

SACK COATS.—In sewing up the side seams hold the back easy over the blade, straight to about 3 inches below the waist, and a trifle short over the hip.

THE SHOULDERS.—The front shoulder may be slightly stretched from the middle of it, to the shoulder point and the back held easy over the same parts, but never stretch it for a stout person.

THE EDGES.—Always dip the stay tape in water and press before using it. When basting stay tape on the front edge, hold it short over the breast, and work the front edge in, so that the roundness of the breast is pressed in to the middle of the front and the edge becomes straight. For a stout person, hold the stay tape short over the most prominent rounding, which is over the waist. In all straight front coats, such as over coats, double breasted sacks, or straight front sacks, the front edges must be worked in until they are straight.

THE SLEEVES.—In sewing up the front seams always begin at the top, and, basting on the upper sleeve, keep both upper and under sleeves even for about 3 inches; from there down hold the upper sleeve a little short to about 3 inches from the bottom, and from there down hold them even. When sewing up the back seam, begin also on top, and basting on the upper sleeve, keep them both even to the elbow, over the roundness of the elbow hold the upper sleeve easy, and from there down even.

Before basting in the sleeves straighten out the armseye, and take a linen thread, draw in the back part of the armseye from the shoulder seam to about $1\frac{1}{2}$ inches below the side seam, and press the fullness away so as to leave a pocket over the blade bone.

When basting in the sleeve, begin with the right one and placing the seam of the sleeve to the nick of the back hold it even to about 1 inch beyond the shoulder seam, from there on full the sleeve in until the front nick of the sleeve reaches the nick of the front; from there hold the sleeve even until you reach the part of the armseye that is drawn in with the linen thread and full the under sleeve in over it.

THE COLLAR.—Collars are to be put in easy in the hollow of the gorge for normal or slim persons. A concave shoulder needs a longer collar than a normal shoulder. A stout person needs a shorter collar than a normal person. In either case, don't stretch the collar stand.

FROCKS

In basting the side body to the front, always begin and keep them even at the armseye and hold the side body a little short at the waist.

THE SKIRT.

After the side seam and fish are sewed and pressed open, baste a piece of stay tape to the bottom, or the waist seam of the side body, so as to prevent it from stretching, after which baste the skirt on, beginning at the side, hold the skirt and side body even to the side seam; from there on for about 4 inches hold the skirt full, and from there on even to the front.

In sewing the back to the side body, begin at the armseye and keep both back and side body even to about 4 inches from the waist; from there down full the back in about $\frac{1}{4}$ or $\frac{3}{8}$ inch; *don't stretch the side body* until after the back is sewed on to it, and then only just enough to make the back seam straight. Shrink in the side body half way.

THE PLEATS.

The proper way to make the pleats is to put a baste in $\frac{1}{4}$ inch or a seam back from the mark stitch, and press the roundness of the skirt in until the pleat is straight, press it open as if it were a seam. Pull the baste out and it is ready to be joined to the back.

The shoulder, collar and sleeves are the same as in the sack coats.

In double breasted frocks or dress coats all the seams are joined the same as the single breasted coats, except that the rever is held short over the breast and the bell shape skirt needs but little fullness at the waist.

VESTS.

All vests cut by this system need no collar stand, as the stand is cut on the vest.

THE EDGES.—All the front edges are to be made straight with the stay tape, i. e., they are to be worked in until the edge is straight and the fullness pressed in to the middle of the front.

THE SHOULDERS.—The shoulders ought to be stretched slightly and the back held full over them. The collar, if there be one, should be held easy to about 3 inches from the shoulder and from there held short to about 2 inches from the front edge.

Double breasted vests, with or without collar, or dress vests with low openings should have stay tape laid around the opening and held short so as to prevent the edge sticking away from the shirt front.

Double breasted vests, and double breasted coats must have more breast worked in them than single breasted vests or coats.

TROUSERS.

Avoid stretching trousers, except the inseam of the back part from the knee to the crotch, and that only $\frac{1}{2}$ inch. Any stretching on the forepart is sure to spoil them. Let the notches come together evenly; hold the forepart easy over the knee and the back part hold easy over the calf.

Peg top trousers should have the roundness from over the hip pressed in to the back. Let the fore part be held easy over the back part from the hip to the knee. Waist bands should be held a little short over the fore part, easy in hollow of the waist and even from there back.

The right fly should be held easy in the hollow of the crotch. Let all the shaping be done by shrinking. *Do not stretch.*
